

Open Access Systems Solution overview

CONFIDENTIAL

- The vast majority of Springer Nature Hybrid journals which are part of the “standard workflow” are migrating onto a new enhanced platform, the Open Access Systems Solution by December 31.
- This system supports the confirmation of institutional Open Access eligibility, payment of Article Processing Charges (APCs), and signing of the publishing licence and declaration of third party rights forms after an article has been accepted for publication.
- The Hybrid journals marked as “non-standard workflow” journals in the [journal title list](#) retain their manual solution.
- The Academic Journals which were “non-standard” will be migrated onto the new solution by December 31, 2020 so will no longer be manual.
- Journals will be migrated in a series of tranches, with full migration complete by the end of 2020.
- The functionality of the new system is in line with *MyPublication* but the look and feel are much improved and updated.
- SN is working on improving the author journey further in 2021 and will update you accordingly

Invitation upon article acceptance

CONFIDENTIAL

Once an article is editorially accepted for publication, the author receives an email with a link to complete the publishing agreement

SPRINGER NATURE

Dear Dr. Jens Nielsen

Congratulations on the acceptance of your article: Demo Manuscript 043.

Before we can proceed with the publication of your article in Review of Derivatives Research, we first need you to complete the appropriate publishing agreement.

The story behind the image

Antarctica meltdown could double sea level rise

Researchers at Pennsylvania State University have been considering how quickly a glacial ice melt in Antarctica would raise sea levels. By updating models with new discoveries and comparing them with past sea-level rise events they predict that a melting Antarctica could raise oceans by more than 3 feet by the end of the century if greenhouse gas emissions continued unabated, roughly doubling previous total sea-level rise estimates. Rising seas could put many of the world's coastlines underwater or at risk of flooding and storm surges.
